

Safety Requirements

Caring

Because of its density and mass, the Marbled Salts may seem like a strong and tough material.

Nevertheless it remains sensitive and fragile as sea salt naturally is.

In order to maintain your piece in an optimal state, we strongly advise you to :

- Avoid all contact with liquids of any nature. If contact happens, absorb and clean immediately with a dry towel.
 - in case of stains we advise you to sand of the surface by hand or with an orbital sanding machine.
- You can start with a very rough grain (100) and finish the surface as shiny as a mirror with a very fine one (2000).
Once the job done you can apply 2 or layers of epoxy resin with a spatula or a brush (watch out for traces though).
We advise to use an eco-resin made for coatings (under 5mm thickness) and UV resistant. Don't hesitate to contact us for brands and references.
- Avoid all chocks even small. Repetitive chocks might result in cracks and an early degrading.
 - Keep indoor in a dry place, preferably on a wooden floor or a mat. If your marbled salt piece is standing on ceramic tiles or a stone floor we strongly advice to place a couple rubber patches on the surface in contact with the floor. We can also do it for you !
 - Clean your piece with an air pressure device such as a compressor and/or a dry towel.
- You can maintain the luster and the colors with a non colored wax for stones and countertops, or with uncolored lubricants such as silicon spray.

Shipping/Transportation

- Whenever moving your piece, carefully pack it in a minimum of three bubble paper layers with a special care to the top edges, before tightening with plastic tape and if possible add several layers of plastic film around.
- Always transport the marbled salt in its crate of origin, place the piece upside down on top of foam boards and protect the sides of the crate with the original foam boards as well.
